Hiring Team

PM Accelerator

Re: Application for AI Engineer Intern - AI/ML/Gen AI Design & Development

Dear Hiring Team,

I am excited to apply for the AI Engineer Intern position at PM Accelerator. As a 17-year-old full-stack AI developer with hands-on experience in RAG architectures, LLM applications, and modern web frameworks, I am drawn to your mission of empowering the next generation of AI professionals through real-world projects and mentorship. The opportunity to work on cutting-edge GenAI applications, collaborate with a multidisciplinary team, and learn from mentors at top-tier companies aligns perfectly with my career aspirations and technical background.

My journey into AI began with a curiosity about how machines could understand and generate human-like text. This led me to develop Daleel (daleelbh.com), an AI RegTech platform using a custom RAG architecture paired with the Claude API and Voyage AI embeddings. This project enables context-aware semantic retrieval across government frameworks, delivering fully-cited compliance answers. Building Daleel taught me the practical challenges of implementing RAG systems—from optimizing embedding pipelines to ensuring response accuracy and compliance. I am particularly excited about PM Accelerator's focus on GenAI application development and prompt engineering, as I have hands-on experience with these technologies and am eager to deepen my expertise.

In addition to Daleel, I built Thrift Trip (thrifttrip.vercel.app), an AI travel assistant powered by Google Gemini that analyzes flight/hotel costs across 30+ locations. I implemented offline autocomplete for 90+ airports with sub-150ms search response and integrated a stateless REST API with caching and CI/CD. This project deepened my understanding of optimizing AI performance for real-time user experiences. I also developed Motamot (motamotbd.vercel.app), a civic polling platform featuring real-time voting and an admin dashboard built with Next.js SSR, where I integrated live AI-powered Bengali-to-English translation and automated NLP profanity filtering. These projects have given me a strong foundation in full-stack development, AI integration, and deploying scalable solutions—skills directly relevant to the responsibilities outlined in your job description.

I am particularly interested in this role because it offers the opportunity to work on real-world AI products with a team of product managers, designers, and data scientists. I am eager to contribute to both front-end and back-end development, leveraging my expertise in React, Node.js, and Python to build innovative GenAI applications. For example, I could help integrate LLM APIs into user-facing applications, optimize data pipelines for AI models, or develop new features that enhance user interactions with AI systems. I am also excited about the prospect of learning from experienced mentors and contributing to a culture of innovation and excellence.

Beyond my technical skills, I bring a strong sense of initiative and a collaborative mindset. As the Founder & President of my school's Debate Club, I established the institution's first student-led competitive debate program and trained members in public speaking. This experience taught me how to communicate complex ideas effectively and work closely with others to achieve common goals. I am excited about the prospect of bringing this same energy to PM Accelerator and contributing to a dynamic team environment.

I am inspired by PM Accelerator's commitment to hands-on learning and real-world project experience. I am confident that my technical skills, project portfolio, and passion for AI make me

a strong fit for this internship. Thank you for considering my application. I would welcome the opportunity to discuss how my background and enthusiasms can align with the needs of your team.

Sincerely,
Nasif Sajjad
